

Case Study: Uber Holiday Redesign

Overview

This project is an exploratory UI concept focused on how holiday-specific features could be integrated into an existing ride-sharing experience without disrupting its core functionality. The intent was to test how layered, seasonal functionality could improve usability during peak travel periods while maintaining a clean interface.

Figma Workspace

Project Context

Project Goal

Increase ride bookings during holiday seasons by improving the Uber experience with seasonal features, better promotions, and more efficient booking flows.

Problem

During high-demand holiday periods, users struggle with booking availability, discovering relevant promotions, and managing holiday-specific travel needs such as planning trips or coordinating group rides.

| Key Solutions: The Holiday Hub

The redesign introduces a centralized **Holiday Hub** that groups seasonal tools while keeping the standard Uber booking flow familiar and unchanged.

- **Ride Gifting:** Allows users to send someone else a ride as a gift. Intended for friends, family, or holiday occasions where users may want to cover transportation costs for others.
- **Trip Planner:** A simplified planning tool designed specifically for holiday travel to reduce stress during high-demand periods. Users can pre-schedule rides based on their expected holiday itinerary, with all scheduled rides displayed in a clean, chronological overview list.
- **Deliver a Gift:** Inspired by Uber Eats and adapted for the holiday season, this feature allows users to send small items or curated gift deliveries to friends or family.
- **Local Events Access:** A lightweight discovery feature that surfaces nearby holiday-friendly or highly accessible local events to help users quickly find destinations for gatherings, pop-ups, or seasonal activities.

| Conclusion

This project was not intended as a full redesign of the existing Uber application, but rather a simplified exploratory UI concept. The goal was to examine how seasonal features could be layered into an existing product while not interfering with the main functionality of the ride booking experience.
